Securing Dynamic Robotic Behavior in Unpredicted Environments: Enhancing Trust through Adaptive Learning and Cyber Defense

Giselle Roman | Dr. Yugyung Lee | 06/08/2025

Problem Statement Overview

As autonomous robots continue to operate in complex and unpredictable environments, their ability to adapt in real-time scenarios is important. By exploring learning-based methods like reinforcement and imitation learning, this project aims to optimize robotic behavior by developing both adaptive learning and highly secure cybersecurity.

Paper 1: Secure Robotics: Safety, Trust, and Cybersecurity

- Introduced the unified field of secure robotics
  - Trust
  - Safety
  - Cybersecurity
- Trust as non-binary, shaped over time based on experience
  - Asimov's laws
    - Human values and ethics
- Provided taxonomy of trust failures
  - System Failure
  - User Failure

Paper 2: AI and ML Enhance Robot Decision-making

- Survey-style overview of AI/ML in robotics
- Emphasized real-time adaptation
  - Reinforcement Learning (RL): exploring its environment to receive feedback
  - Intimidation Learning (IL): data provided to learn from
- Showed case studies
  - Da Vinci Surgical System
  - Boston Dynamics' Spot Robot

Paper 3: Adversarial Attacks

- Deep Reinforcement Learning (DRL) agents
  - Vulnerable to small perturbations
- Focused on white-box vs black-box attacks
  - White-box: attacker has full access to the robot's model
  - Black-box: attacker has no internal knowledge
- Fast Gradient Sign Method (FGSM) attack method
  - Adversarial attacks during training and testing

AI Methods

- Reinforcement Learning (RL)
  - Adaptive decision-making
- Imitation Learning (IL)
  - Learning from demonstrations
- Adversarial Robustness
  - Attack simulations to test defenses
- Perspective API
  - Potential tool for modeling trust and feedback

Challenges

- Transitions from simulation to real world environments
- Trust feedback system
  - Measure and responding to users
- Implementing Runtime Adversarial Defenses
  - Best way to detect or defend against adversarial inputs
- System Integration
  - Learning models, cybersecurity tools, and trust
